

1. Create DataFrame

```
df = pd.DataFrame(data, columns=[...])
```

2. Filter

```
df[df["Status"] == "Delivered"]
```

3. Filter with condition

```
df[df["ReturnStatus"] == "Overdue"]
```

4. Group and count

```
df.groupby("MemberID").size()
```

5. Group and sum

```
df.groupby("CustomerID")["Amount"].sum()
```

6. Create calculated column

```
df["IsOverdue"] = (  
    df["ReturnStatus"] == "Overdue"  
)>.astype(int)
```

7. Fill missing values

```
df["Amount"] = df["Amount"].fillna(0)
```

8. Remove duplicates

```
df.drop_duplicates(  
    subset=["OrderID"]  
)
```

9. Sort

```
df.sort_values(  
    by="Amount",  
    ascending=False,  
    inplace=True)
```

```
"Completion Percentage",  
ascending=False  
)
```

10. Pivot

```
pd.pivot_table(  
    df,  
    index="Restaurant",  
    columns="Status",  
    values="OrderID",  
    aggfunc="count",  
    fill_value=0  
)
```

Recommended classroom approach

For your trainees, I would **not give them the complete solution immediately**.

Use this progression:
